Stan Meyer is shown with a lab model required by the patent office illustrating part of the Water Fuel Cell energy system. This is only one of eight patented systems of the Electro-Partial Generator which produces electrical energy. With these models, Meyer can use the energy from water to produce the electricity needed to run the generator. This and other models are forerunners of the Electrical Home Power Generator which he hopes to develop for home usage (photo by Marcia Thompson)

In October of 1984 and again in October of 1985, stories appeared in *The Grove City Record* about the invention of Grove City resident, Stan Meyer. The 1984 copyrighted story introduced Meyer's Water Fuel Cell technology to the public and told how Meyer was developing a new energy source using the hydrogen and oxygen molecules of water to obtain fuel. The 1985 story presented the details of his first run with a **dune buggy using only water**—along with the **Water Fuel Cell technology as power**. Now, one year later, where does the Water Fuel Cell technology stand?

History of development

The history of the Water Fuel Cell technology development has been an ongoing process. Since the running of the dune buggy on water alone, the mass natural energy system and the Water Fuel Cell technology have been in full development toward pre-engineering a system both locally and worldwide.

Via ABC television newscasts, Meyer has been continuing to develop the technology pertaining to injector systems in preparation for taking a trip across the country by water-powered car after the technology is fully developed and legalized. In the interim time to the current date, he's been finishing several major research and development projects which had to be fully developed before the Water Fuel Cell technology could be presented to the marketplace.

Stan Meyer, inventor of the Water Fuel Cell, is shown with a lab model of the Resonant Cavity technology, one of four major developments which are pertinent to the Water Fuel Cell technology. It is only one of many different types developed and tested to study the phenomena of resonant action, which produces high amounts of hydrogen-oxygen gas on demand. Many different patented processes had to be developed, and this is only one of many steps in the development of the electro-polarization process of splitting water molecules with the influence of voltage. To his immediate right is a control box of electronic circuitry interfacing to the resonant cavity technology. It operates on a revolutionary new patented technology which Meyer developed when he found he couldn't rely on current technology to demonstrate and operate his Water Fuel Cell. (photo by Marcia Thompson)

Before the pre-engineering design of Water Fuel

Cell technology can be finalized for mass production, other major goals had to be reached, including:

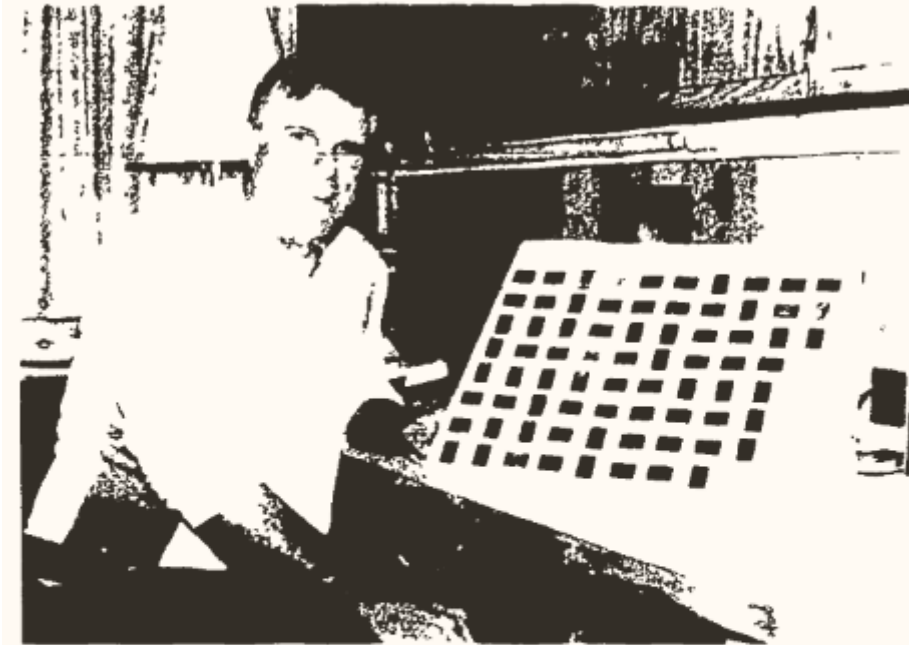

1. **Processing over a four and one-half foot stack of legal paperwork** to standardize the legal rights of the technology.
2. **Finalizing the technology of the Electric Polarization Generator.**
3. **Completion and finalization of the base for the Gas Dynamic Electric Generator** and completing all patent work for issuance of patents already received.
4. **Completing the design work on the Rotary Pulse Voltage Frequency Generator** for mass production and receiving the patents on that and related technology.

In order to complete the entire development package, Meyer has found it necessary to work on and develop, to invent, and study the phenomena to establish engineering workability of the system's concept, always working towards the concept of mass development and to integrate the use of atomic power. It has been a step-by-step development, which has included the following areas:

1. Finding an economical way to produce gas from water.
2. Developing that ability to enhance that energy for home, car, military, industrial, and other usages.
3. Developing the ability to process the hydrogen gas so it's as safe to use as natural gas, and **stimulating electrical energy** to make the system operate.
4. Making the hydrogen gas so it can be recycled for hydrogen reuse, which entailed the development of the Water Fuel Cell Purification technique.
5. Developing the technology to utilize the properties of hydrogen gas for electric production, which is referred to as the **Energy Feed-Back System.**

Military applications

Meyer has already gone to **Washington, D.C.**, and has made preliminary presentations at the **Pentagon** to **General Abrahamson** and staff and members of NASA, pertaining to using the Water Fuel Cell, Atomic Gas Gun, and related technology in the **Star Wars development program**. As research and development finalizes, this will continue to be pursued.

Stan Meyer, Grove City resident and inventor, is shown as he finalizes the preparations for a professional technical audio-visual presentation on the technical base of the Water Fuel Cell technology which will soon be given to members of the U.S. Government and the military at the Pentagon. The special presentation is being prepared so the technology can be properly presented to the government, military, and industry so everyone will understand what he's been working on and why. Inquiries have been made by foreign governments and presentations are planned for the Canadian Parliament and for governments in Europe. (photo by Marcia Thompson)
