

8-2 - Traveling Voltage Wave-Guides

730

The formation of tubular **Traveling**

Voltage Wave-guide (570a) of Figure (7-12) (WFC Memo 426) as to (770) of Figure (8-1) is physically formed when **positive electrical voltage surface** (66/E9) and **negative electrical voltage surface** (67/E10) are placed in parallel space relationship to form voltage surfaces (E9/E10) about an cylindrical axis of rotation having space-gap (35) there between and thus, fanning **Cylindrical Resonant Cavity** (730A) of Figure (7-12) as to (770A) of Figure (8-1) when **space-gap** (616) of Figure (720) exposes **injected water bath** (85) to unipolar pulse-oscillation of high voltage intensity of **opposite polarity** (67/66) as to (780) of Figure (8-2) which, in turn, propagates **opposite electrical attraction force** (RR' _ 88') of Figure (7-4), as illustrated in (590) of Figure (6-2) as to (585) of Figure (8-1).

The diagram illustrates a programmable unipolar pulse-train. It features a series of periodic, rounded rectangular pulses. Key parameters and labels include:

- VOLTAGE PEAK POTENTIAL (V_{pp})**: Indicated by a vertical double-headed arrow across the height of a pulse.
- PULSE WAVE FREQUENCY (Pwf)**: Indicated by a horizontal double-headed arrow across the period of two pulses.
- TRAILING EDGE (V_{pb})**: Points to the downward slope of a pulse.
- LEADING EDGE (V_{pa})**: Points to the upward slope of a pulse.
- VOLTAGE PULSE WAVE FORM (V_{pwf})**: Points to the overall shape of the pulse train.
- +609n / - 611n**: Labels for the positive and negative voltage levels relative to the baseline.
- ELECTRICAL CONDUCTANCE ZONE (587) (SKIN EFFECT)**: Points to the area under the pulses.
- VOLTAGE PULSE WIDTH (V_{pw})**: Points to the duration of a single pulse.
- WATER SURFACE TENSION (584)**: Points to the baseline level.
- +609a / - 611a**: Labels for the positive and negative voltage levels relative to the baseline.
- VOLTAGE SURFACE (67 OR 66)**: Points to the area under the pulses.
- ELECTRICAL**: Points to the area under the pulses.
- VOLTAGE WAVE DIRECTION**: Indicated by a horizontal arrow pointing to the right.
- V0**: Points to the baseline level.
- 64n, 64c, 64b, 64a**: Labels for different voltage levels or components.

(A) PROGRAMMABLE UNIPOLAR PULSE-TRAIN

... forming tubular voltage wave-guide (s) (570) of Figure (7-12) that, now, becomes the same physical configuration of **Water Gap** (616), as illustrated in (720) of Figure (7-11).

(580) of Figure (6-1) (WFC memo 425)

The diagram illustrates a VIC coil assembly. On the left, an input signal is shown as a waveform with labels $\frac{1}{T_1}$, $\frac{48a \times 46b}{T_2}$, and $\frac{1}{T_2}$. This signal enters a BOBBIN CAVITY (505) through an INPUT. Inside the cavity, there are several layers: a DUAL RESONANT COIL (5062), a BIFILAR SPIRAL WIND COILS (5071a xxx 5071c), and a RESISTIVE PICKUP COIL (505). The cavity is surrounded by an ELECTRICAL STEEL CORE (501). To the right of the cavity is an INDUCTANCE COUPLING (5071a xxx 5071c) which is connected to a PULSATING MAGNETIC FIELD (71a xxx 72c). This field is associated with MAGNETIC FLUX LINES (5071a xxx 5071c). The output of the assembly is shown as a waveform on the right, labeled $\frac{64a \times 64b}{\text{Output}}$. Other components include a SECONDARY PICKUP COIL (502), SPIRAL WRAP COILS (505a xxx 5050), and a DUAL PRIMARY COIL (501) with 30 GA MAGNET WIRE (501a xxx 5070).

The surface tension of water (584) adjacent to both voltage surfaces (E9 / E10) further aids the transmission of voltage potential (66/67) since **Electrical Charging Effect** (585) of Figure (7-4) does not change or alter the dielectric value of water (Re).

650

FIGURE 7-4: ELECTRICAL CHARGING EFFECT

Together, the **Voltage Coefficient of Water** (e/E_0) of **Equation (Eq 21)** and the **Voltage Coefficient of the stainless steel** (s/s) material fanning voltage surfaces (E9/E10), now, allows the establishment and performance of **Traveling Electrical Voltage Wave-Guide** (583/602) since electrical conductance zone (587) between electrical surface (S) (E9/E10) and the **dielectric surface tension of water** (584) acts and performs as a electrical conductor (*Skin Effect*)

$$C = \frac{0.2249 e A}{d E_o} \text{ Picofarads}$$

... since electrical transmission zone (587) is almost free of electron leakage

...since **Water Bath** (85) is a dielectric-liquid (typically 78.54Q) that does not like to transfer nor exchange electrons

... thereby, maintaining **voltage amplitude potential** (V_o - 64a - 64b - 64c - V_n) of Figure (8-6) without experiencing amp arc-over across **Water-Gap** (616) in any appreciable amount

... allowing pulsating opposite electrical attraction forces (RR' / SS') to perform the work of "**Electrically Charging**" water bath (85) to bring-on and trigger **Hydrogen Fracturing Process** (90) of Figure (5-5), as illustrated in **Energy Pumping stage** (520) of Figure (5-3).
