

Capacitance Reactance

Capacitance Reactance is determined by the insulation resistance ($R_s + R_e$) and Inductance (L_1/L_2) interacting together during D.C. Pulsing.

Dielectric property of water opposes amp leakage (R_e) while another property of water takes-on an "**Electrical Charge**".

Water temperature (R_t) (cool-to-the-touch) keeps (R_e) constant since amp flow remains minimal.

Plate Inductance (L_c) is **Inductance Reactance** of **Inductor** (L_1) and **Inductance Reactance** of **Inductor** (L_2) in series with Resonant Capacitor (140 -170) of Figure (7-6) as to (690) of Figure (7-8).

Resonant Capacitor (140 -170) of Figure (7-6)

670

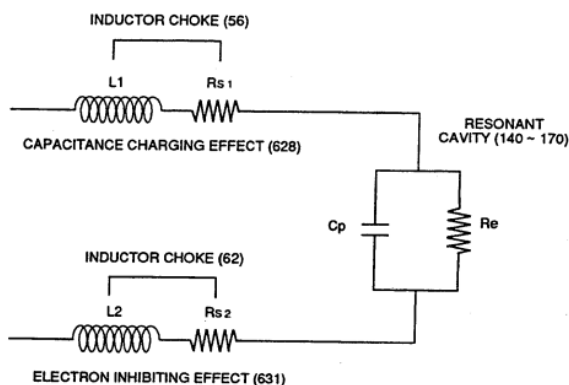

FIGURE 7-6: RESONANT VOLTAGE EFFECT

(690) of Figure (7-8)

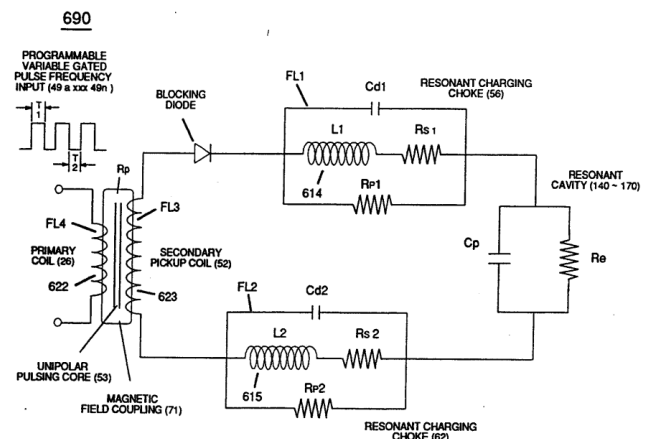

FIGURE 7-8: VIC MATRIX CIRCUIT

In terms of **Component Reactance**, Inductors (L_1/L_2) should always be larger than Capacitor (ER) of Figure (7-2) in order to maximize amp restriction to enhance "**Voltage Deflection**" ($SS' - 617a \times \times \times 617n - RR'$) of Figure (7-4) and, is expressed by :

Capacitor (ER) of Figure (7-2)

630

650

(Eq 24)

$$Z = X_L - X_C$$

Whereas,

Capacitor (ER) should remain relatively small due to the dielectric value of water to obtain maximum **Thermal Explosive Energy-Yield** (16a xxx 16n) of Figure (4-5) and subsequently establishing **Quenching Circuit** (370) of Figure (3-40) to prevent gas ignition inside traveling voltage wave-guide (590) of Figure (6-2) as to (730) of Figure (7-12)
