

Fuel-Gases / Quenching Tube

The liberated and traveling **Fuel-Gases** enters into and passed through a patented **Fuel-Gas Processor (E)** that performs and functions as a **Gas Ionization Chamber** when another Voltage Intensifier Circuit (A3) is activated by Gas Acceleration Control Unit (B/F), as illustrated in Figure 2 as to Figure 7

Figure 7: Indy "500" Car

Voltage Intensifier Circuit (A3) is

interlocked with **Safety Control Circuit (D)** through **Electronic Control Unit (B)**.

Gas Bleed-Off Valve prevents unwanted gas pressure during engine "turn-on stage".

The Fuel-Cell Assembly of Figure (7) is directly retrofitted to the car engine without engine-change since the patented **Hydrogen Gas-Mixture** co-equals the burn-rate of Alcohol (from 325cm/sec. to 44 cm/sec.), as illustrated in Figure 4 as to Figure 5.

Non-combustible gases (gases that do not support the Gas Combustion Process) supplied by the Water intermixes with the liberated hydrogen and oxygen gases to form the hydrogen gas-mixture (44 cm/sec.)

The hydrogen gas-mixture remains constant regardless of the gas flow-rate since water acts and performs as a Gas-Mixing Regulator.
