

Multi-layer Coil

Inductance of a multi-layer coil of rectangular cross section can be computed by below formula when optimizing maximum distributed capacitance ($C_{da} \times \times C_{do}$) and distributed inductance ($D_{la} \times \times D_{ln}$) of Figure (7-3) to intensify **Inductance Field Strength** ($F_{La} \times \times F_{Ln}$) to function as a voltage multiplier in switch-off conditions (612a $\times \times$ 612n), as illustrated in (710) of ~ . Figure (7-10) as to **VIC Coil Assembly** (580) of Figure (6-1) and, is expressed:

(580) of Figure (6-1)

FIGURE 6-1: (VIC) COIL ASSEMBLY

(Eq 20)

$$L = \frac{0.8 (N \times A)^2}{6A + 9B + 10C} \quad \text{Bobbin Cavity}$$

Where,

(L) is the **inductance** in microhenries,

(N) is the **number of turns**,

(A) is the **mean radius** in inches,

(B) is the **length of the coil** in inches,

(C) is the **depth of the coil** in inches.
