

Using Water as Fuel

The **Atomic Energy Balance of Water** is activated and performed in a sequence of events in an instant of time. The **Hydrogen Fracturing Process** simply triggers and releases atomic energy from natural water by retarding and slowing down the reformation of the water molecule being subjected to sub-critical state during thermal gas ignition.

The **Voltage Intensifier Circuit** brings on the **Electrical Polarization Process** that switches off the covalent bond of the water molecule without amp influxing. **Energy Pumping Action** undergoing "**Resonant Propagation**" of opposite electrical stress oscillates the "**Energy Aperture**" of the combustible gas atoms to increase the atomic energy level of the combustible gas atoms prior to gas ignition.

The **Electron Extraction Process** ionizes the highly energized combustible gases to decrease atomic mass while applied **Voltage Pulse-Frequency** of opposite electrical polarity initiates the triggering process once maximum voltage deflection is achieved ... releasing thermal Explosive Energy (gtnt) beyond normal gas burning levels.

The energy contained in a gallon of water exceeds 2.5 million barrels of oil when equated in terms of atomic energy. Water, of course, is free, abundant, and energy recyclable.
